

## WHAT'S IN WATER?

## SEE, TASTE, SMELL

The contaminants that can be sensed are the most common ones we know about. You can feel the hardness caused by natural minerals. You can taste the chlorine from municipal treatment. You can smell the rotten egg odor from the sulphur that comes from the Earth. And you can see the staining left behind in your home from iron in the earth or buildup in pipes.

## NOT SENSED

These contaminants can be the trickiest. So many of them we don't see so we don't think of them. Ecoli from microorganisms. Byproducts from disinfecting agents. Pharmaceuticals from waste disposal. And there are so many that we are still studying and learning about. These include Forever Chemicals (PFRs) from over 3,000 human-made chemicals, and plastics in the environment that never fully decompose, but break down into microplastics.

## DELIVERY CONFIRMATIONS

Please note that part of our delivery process is having you confirm your delivery upon notification. This means our office has prepared your order, our Driver will then load up your product on the truck & deliver to your location on your route day. We will charge a delivery fee if arrive and you decide you do not need or want a delivery. So please notify us of a cancellation before you delivery day.
